Terry for professionals

Brand quality from the producer – perfect in use

Institutional use
Professional terry linen for industrial laundering. Standards from warehouse with approx. 2.500 pallet places for short term delivery.

Trade & Promotion
Brand quality with more than 1.000 articles on stock for wholesalers, delivery in flexible quantities

Terry Refinement & Care
Ideas for custom made and individualisation, tips for proper handling and care

Our terry products are strictly conceived in relation to their use and the demands of our customers. For this purpose, we have developed our own specifications with regard to yarn and fabric, color and seams, treatment and finishing. This results in qualities with extreme fastness in terms of fabric, form and color. Their long life cycle renders them profitable in laundering and as leasing textile. Full grip and high comfort, lasting softness and best absorbency are assets which are highly appreciated by guests in Hotels of all categories.

No wonder, our towels and bath robes have become a brand name in 5-Star Hotels, in Spa & Wellness centers and fulfill an excellent job on Cruise liners. As promotional articles our terry products are not just expressive but generate effective and lasting sympathy.

With respect to use and market we have split our warehouse assortment in two catalogues: with articles for institutional use on the one hand and standards for wholesalers & promotional sellers on the other. You will find ideas and recommendations for custom made & refinement in a third catalogue. All catalogues contain tips for proper handling and care as well as a subject-specific terry glossary.

Please do not hesitate to ask your contact person for any questions. We would like to support you with our competence and hope you will enjoy our products.

Bernhard Egner/Johann Geisslinger
General Managers

Institutional use

Terry for professionals – optimal in use & comfort

In this catalogue you will find terry products which are ideally suited for Hotel, SPA, clinic and care centers. All articles excel by lasting softness, high water absorbency and a very long life cycle. Cotton terry qualities are woven in high quality yarns in warp, weft and pile. Dyeing, design and finishing live up to the demands of intensive washing and drying cycles. For example, white towels are bleached with neutral optical brightener, colored towels are vat dyed for high fastness and resistance against chlorine. Towels have dense and double seams on the long sides. Bath robes are either in full body cut or with Raglan cut and have either no side seams or a clean stitch on the sides. Please compare qualities on the market in detail as this has a direct effect on your rate of return.

For every product we inform on use, material specification, seams and finishing. In summary, high efficiency and utmost customer satisfaction render our terry products very profitable. They are a token for sustainable market success.

Consequently, our norms for raw materials, production and finishing go far beyond conventional standards. We have also focused on energy saving qualities which considerably enhance the ecological life cycle assessment of valuable cotton yarns.

In the year 2016 we have edited our first sustainability report according to GRI (Global Reporting Initiative). Measurement and scrutinized reporting has made clear that quality and sustainability are inextricably linked with each other. Being a German company we would like to point out that fairness and a reliable 360° service performance must also be added to the aggregate value.

Nachhaltigkeit
Sustainability Report according to Global Reporting Initiative (GRI), with structure and data for international standardization and comparison

Products according to G.O.T.S. Organic standards go beyond grey cotton yarn and encompass production chain including social norms.

Products acc. to Oeko-Tex Standard are checked with regard to the harmlessness of substances. We put emphasis on auditing by German Textile Institutes.

Companies according to DEKRA are audited according to quality management norm ISO 9001. We work with upgrade standard ISO 9001:2015

production with special colours is possible with a minimum quantity of 250 adult bibs.

Adult bibs with lamination

knitted 240 gsm

Solid knitted terry in 240 gsm quality with polyurethane lamination

Washing

Oeko-Tex

Oekotex 100

Asset

Large and lasting. With inside lamination this bib offers maximum protection. Lamination has excellent washing behaviour and is suitable for laundries without exemption.

Quality Details

Material: 64 % cotton, 16 % polyester, 20 % polyurethane

Weight: 240 gsm

Dyeing: white with blue optical brightener

Finishing: with durable piping around the edges, with bands for binding around the neck

Certificates: Oekotex Standard 100

Assortment with colours and sizes

Name		For Binding
Size		50 x 100 cm

 production with special colours is possible with a minimum quantity of 2000 adult bibs

Fitted bed sheets

The way you sleep the way you feel. Feel at ease with cleanly finished and lasting fitted bed sheets.

Fitted bed Sheets

180–190 gsm

Fitted bed sheets – In Terry or Single Jersey quality

Washing

Oeko-Tex

Oekotex 100

Asset

Fitted bed sheets in two reliable qualities for laundries and hotel suppliers. Delivery from stock in a variety of sizes. They can also be produced custom made in specific size and colour and also for the specific height of mattresses.

Quality details – Jersey Line

Material: single Jersey, 50 % cotton/50 % polyester

Weight: approx. 190 gsm

Dyeing: white

Design: with an all-around elastic band which is suited for permanent washing and drying

Quality details – Terry Towelling Line

Material: Terry Towelling, 80 % cotton/20 % polyester

Weight: approx. 180 gsm

Dyeing: white

Design: with an all-around elastic band which is suited for permanent washing and drying

Assortment with colours and sizes

Style	fitted bed sheet	fitted bed sheet	fitted bed sheet
Sizes	90–100 cm x 190–200 cm	140–160 x 200 cm	180–200 x 200 cm

production with special colours is possible with a minimum quantity of 150 fitted bed sheets

Care tips

Important information on adequate washing and drying

Washing temperature – follow label instructions

Use exactly the washing temperature which you will find on your product label. Do not wash with lower temperature as then colors may faint. Sufficient temperature enhances color fastness. Regarding first washing, also colored qualities should be washed with 95 °C (203 °F), in order to stabilize color in the cotton yarn.

Colored terry cloth – wash 3 x separately, without optical brightener

Please wash dark and intense colors three times separately. Colored qualities should be washed with detergents which contain no optical brighteners. Optical brighteners may cause stained colors. For dosage please follow the instructions of your washing detergent producer.

White terry linen – use laundry detergent (with optical brightener)

White linen should be washed with laundry detergents. They contain optical brighteners which create a shiny white color. For proper dosage please follow instructions of producers.

Twin Star – single-origin in laundry

Please do not mix Twin-Star quality with other cotton terry qualities. Otherwise you will not profit from its energy saving effect in drying.

Avoid fabric softeners – and keep towels absorbent

Fabric softeners lay themselves onto the texture and have a repellent impact on water absorbency of terry linen. They may also enhance fluffs.

Fill washing drum with at least 50% – dose detergent properly

Sufficient loading is important. With too little filling terry cloth beats against the drum, which increases the development of fluffs. Exact dosage of detergent is also important. Too little as well as too much detergent reduce brightness of colors and stiffen your terry linen.

Dry at best with tumbler – and keep towels fluffy

With tumblers, terry cloth becomes pleasantly soft and will be freed from fluffs. Please check that temperature of tumbler is not excessive. Over-dried cotton yarn becomes stiff and deform. Drying terry linen outside or over radiators is not advisable. It makes terry cloth also stiff.

Additional info for polyester and Twin-Star

Qualities from and with polyester start to smelt at a temperature of 230 °C (446 °F). Yarns shrink to knots and surface becomes rough. Please take care that you keep the tumbler heat in respective limits. Do not wash mixed polyester fabrics together with heavy cotton qualities as this may also result in overheating the polyester yarn.

Be aware of typical characteristics and avoid damages

Fluffs – only in first washings

Cotton towels with fluffy pile excel in water absorbency, but have a natural disposition for fluffs. Do not worry because of fluffs as they will be washed out after the first washings. They will be low when you wash your cotton towel adequately.

Shrinkage – a natural habit of terry linen

Every terry linen shrinks after the first washings. Due to high quality yarn and professional textures our terry linen does not shrink more than 7–10 % and holds proper form for a long time.

Loose threads – just cut them off

Terry linen has a texture with strong ground and soft loops on the surface. During production it can happen that towels are left with a loose loop or thread. Please do not pull them, just cut them off. Neither texture nor seam will be damaged.

Lay Velcro® fasteners properly – wash zippers and hooks separately

Hooks, zippers and loop fasteners can cause grave damages on your terry article. Therefore, do not wash terry linen together with zippers and hooks. Please, position sides of Velcro® fasteners on top of each other.

Unload drummer with care – do not pull with force

Wet terry linen is heavy, wet terry texture is less stable than in dry condition. Do not forcibly pull bath robe at sleeves and belts as this may cause damages at seam and texture.

Attention with chlorine – use only resistant dyestuff

Chlorine can change color of dyestuff and may even destroy texture of terry linen. Impact of chlorine is very strong in combination with heat, and consequently during washing and drying. Follow instructions of producers for the adequate dosage of chlorine.

Avoid chlorine with reactive colours

Terry linen as home textile is often dyed with reactive colors. They have very good washing characteristics but react badly when they get in contact with chlorine. Please take into account that chlorine may also be found in bleaching and disinfecting agents as well as in bathroom cleaners.

Use vat dyed colors with chlorine – follow instructions for temperature and dosage

For institutional terry linen we recommend vat dyed colors, known as Indanthrene dyestuff. They are resistant against chlorine within the limits of recommended dosage and temperature. Please follow respective instructions of producer carefully.

Impurification with oil

We recommend to wash the article first with cold water and use an adequate detergent for purification afterwards. Water temperatures over 30 °C (86 °F) would fix the oil, e.g. massage oil, even more and will damage the quality for the time ahead.

Terry-Abc

Yarn

Combed cotton yarn refers to the fact that there is technically an additional procedure between carding and spinning: A needled roller sorts out short yarns and creates a yarn band (pile) in equal thickness and direction.

Carded ring spun yarn are ideally suited for lasting and cozy terry qualities: ring spun yarn is twisted in high speed which results in thin, soft, tear-proof and abrasion-resistant yarns. Before spinning, cotton yarn is carded i.e. fibers are loosely exposed and brought into a parallel structure. Because of these characteristics we recommend to produce cotton terry qualities with carded ring spun yarn in pile, warp and weft. Average life span of this quality is well over 30% to fabrics with OE-yarns.

Microfiber – extremely thin fiber from polyester. We produce knitted terry qualities from pure microfiber which is highly recommended in the cosmetic sector. Like any polyester yarn, microfiber has an extreme color fastness and does not take up other colors. Mixed fabrics from microfiber and cotton can optimize the characteristics of terry qualities in manifold ways – see polyester and Twin-Star quality.

OE-Open-end-yarns are produced by rotor spinning machines which work best for stiffer fibers with a low tendency for curling. OE-yarn has a harder grip than ring spun yarn and has lower stability. In terry qualities, OE-yarn can be used in weft. It is not suited for warp and pile as far as it concerns a high quality terry product.

Polyester – an often misunderstood fiber which deserves a clarification: high quality polyester fibers can optimize the characteristics of terry fabrics, especially for institutional use. Most important are factors like softness, tear-proof, elasticity and energy saving.

Premium-Soft-Yarn is a wonderfully pleasant yarn out of combed cotton, taken from piles in long staples. Extreme softness, high volume and excellent absorbency are its properties. Premium-soft yarn is ideal for institutional bath robes which stay soft over the whole life span.

Fabric

Well soft or poly soft is polyester which is pushed up. Covers in well soft quality are extremely fluffy and warming. As knitted fabric and in proper confection, they are tear proof and an easy-care product.

Twin-Star quality is an innovative fabric from Floringo, ideally to be used for the confection of bath robe and terry articles for children. Front side of this material is pure microfiber, reverse

side is pure cotton. Due to the microfiber part, Twin-Star stays soft, has little shrinkage and is energy-saving in tumbler drying. With pure cotton inside it is well water absorbing and gives a natural feeling to the skin. In summary, Twin-Star quality combines noble comfort with an excellent energy and life cycle assessment.

Velours means that terry qualities are shorn and spliced on the front side. Effect is that they get a shiny appearance and a velvety grip. Usually, cotton terry qualities with pile in single or double ply are used for processing into velour. Back side should be in cotton quality in order to be absorbent.

Single ply defines a terry quality with one yarn to be used for each loop. Pile with this kind of loops is very soft.

Knitted terry qualities are not woven on dobby or jacquard looms but on special knitting machines. The most important advantage of this fabric is that threads cannot be pulled. Due to the structure of the fabric it is not possible to move the threads. Consequently, it is not possible to weave motives in knitted quality.

Double ply defines a terry quality with two yarns which are twisted into each other for each loop. Pile in double quality is dense and more equally bent than single ply quality. Grip is more solid. In the same way as single ply, it is excellently water absorbing.

Colors

Vat-dyed colors (known as Indanthrene) are best choice for cotton terry qualities in institutional use. Better known under their trademark “Indanthrene” this dyestuff has untested scores with regard to fastness in terms of light, sweat and heat. Vat-dyed colors are boil proof. Their most remarkable asset is their resistance against chlorine (up to limited degrees – see care tips). The dyeing process is technically challenging. By nature of dyestuff, tolerance for color must be higher than for reactive colors. In comparison with them, impression of color is less shiny.

Reactive colors combine very good washing characteristics with strong and shiny color impression. For this reason, they are ideal for commercial and promotional products i.e. for the use at home. As they are not resistant against chlorine their use in Hotels and Spa must be specifically checked.

Finishing

AIRCO® is the trademark for a patented and protecting hot-air-finishing. Besides reducing fluffs it enhances the volume of the pile and leads to full and fluffy grip before the first washings.

Hydrophilic finishing means that terry qualities become especially absorbent for water. It is applied to high qualities from ring spun yarns and does valuable service also when intensive colors are used.

Turbang® Finishing is a different term, but technically similar to AIRCO® – see above.

Seams and edges

Double hemming refers to the seams at the long sides of towels. Edges are folded twice and then hemmed with a double chain stitch. Solid seams are important in laundering and indispensable for a long life span: wet towels are heavy and beat against drummer and tumbler, a fact which is enhanced by the big loads of industrial units.

Chain stitch is an important version for the stitching of towels. Basically, its structure is like a chain of loops which make a stable stitch but keep the cut edge elastic. Our automatic stitching machines carry out a dense double chain stitch with a minimum of 3,5 stitches per cm.

Overlock stitching has generally the function to combine textile components and to secure them at the edges. Overlocked seams are common for flat fabrics but are not optimal for fluffy terry qualities. We avoid cut edges wherever possible, in order to reduce overlock stitching to the necessary minimum.

Piping – is clean and decorative trimming at the edges. At bath robes, pipings are applied around collar and down to the height of belt, at the end of sleeves and side bags. They are also helpful for the easy sorting in laundering. Piping is also used for covers and hooded children towels. Before, cut edges are secured with a whipped seam.

Clean hemming – most important for bath robes, especially at long sides. Cut edges are first secured by means of a whipped seam, then folded to the side and finally hemmed together with the underlying fabric. Clean hemming leads to a closely applied and stable, clean and highly comfortable seam.

Backstitch and lockstitch are basically identical. Both refer to a stitching process where the needle goes back and force with the possibility to close small gaps. Backstitches lead to a very stable seam which we apply at the short sides of our towels. With regard to embroideries, it is especially used for fine shapes and outlines.

Cutaway models – bath robes

Full-body-cut means that the body-part (trunk) of the bath robe consists solely of one piece, and has therefore no side seam.

Hooded bath robes are made in a way that capuche and collar are from one piece. Hooded bath robes are ideal for outdoor sauna areas, popular with wholesalers and an ideal cut as bath robes for children.

Kimono derives from the Japanese style and means that collar has no cuff. Kimono bath robes recommend themselves as easy handling and space saving models in institutional use.

Raglan cut means that sleeves and shoulder are one part. Consequently, the sleeve starts at the collar and covers the shoulder part. Bath robes in Raglan cut are easy to dress on and fit perfectly on breast and shoulder. The term refers to the English General Lord Raglan who lost his arm in a battle and is supposed to have invented this cut exactly for this purpose.

Shawl collar means that collar and lapel are one piece. Similar to a shawl, collar and cuff go around the neck, converge at the breast and go down until height of belt. As upgraded version, we recommend to refine the shawl collar with piping and/or well soft trimming.
